

Project 3 Overview

Project Objective: Build a six page website utilizing a single CSS stylesheet to present a visual design that is consistent and effective on all modern browsers and at least three device sizes. This site will use the wireframes/web design/ux plan created in a previous class.

Restrictions: HTML/CSS ONLY (Exception: Any javascript included with framework is fine)

Time allotted: 5 days

NOTE: We had to use wireframes we created from another class and basically turn them into a working website but ONLY the design. So nothing is “functional”. This was basically a project making sure we could create a website based on wireframes. The site didn’t need to look exactly like the wireframes but as close as we could with the time allotted. I included the wireframes as well as the quick mini UX plan I did in the previous class.
